

CLAIMS

[1] A transmission power control method in a mobile communication system in which a mobile station connects with a plurality of radio base stations simultaneously;

in said radio base station, said method comprising:

5 a step of measuring a receiving level of an up-link from the mobile station; and

a step of transmitting up-transmission power instruction information for instructing that up-transmission power be lowered to the mobile station when the receiving level is not less than a predetermined target value and of

10 transmitting up-transmission power instruction information for instructing that up-transmission power be raised to the mobile station when the receiving level is below the predetermined target value:

in the mobile station, said method comprising:

15 a step of receiving the up-transmission power instruction information from the plurality of radio base stations connected thereto; and

a step of determining up-transmission power using only up-transmission power instruction information from radio base stations having down-links of a predetermined communication quality or more, from among the up-transmission power instruction information received from the radio
20 base stations.

[2] The transmission power control method according to Claim 1, wherein, in determining up-transmission power in the mobile terminal, a determination is made to raise the up-transmission power when all pieces of the up-transmission power instruction information from the radio base stations

- 5 having down-links of the predetermined quality or more are instructions for raising the transmission power, and a determination is made to lower the up-transmission power when at least one piece of up- transmission power instruction information is an instruction for lowering the transmission power.

[3] A mobile communication system performing soft handover and transmission power control, comprising:

- a plurality of radio base stations for transmitting up-transmission power instruction information for lowering up-transmission power to a down-
5 link when the receiving level of an up-link is not less than a predetermined up-target value, and for transmitting up-transmission power instruction information for raising up- transmission power to the down-link when the receiving level is below the predetermined up-target value; and
a mobile station for determining up-transmission power using only the
10 up-transmission power instruction information received from radio base stations having down-links of a predetermined communication quality or more, from among the up-transmission power instruction information received from the plurality of radio base stations that are connected by soft handover.

- [4] The mobile communication system according to Claim 3, wherein, in determining up-transmission power by the mobile station, a determination is made to raise the up-transmission power when all pieces of the up-transmission power instruction information from radio base stations having
5 down-links of the predetermined quality or more are instructions for raising the transmission power, and a determination is made to lower the up-transmission power when at least one piece of up-transmission power

instruction information is an instruction for lowering the transmission power.

[5] The mobile communication system according to Claim 3 or 4, wherein said mobile station transmits down-transmission power instruction information for instructing that down-transmission power be lowered to an up-link when the receiving level of the down-link is not less than a predetermined down target value, and transmits down-transmission power instruction information for instructing that down-transmission power be raised to the up-link when the receiving level is below the predetermined down target value; and wherein said radio base station determines down-transmission power using the down-transmission power instruction information received from the mobile station connected thereto.

[6] A mobile station apparatus used in a mobile communication system performing soft handover and transmission power control, comprising:

- a receiver for receiving signals of down-links from a plurality of radio base stations connected by soft handover;
- an up-link transmission power calculation unit for determining up-transmission power using only up-transmission power instruction information extracted from signals received from down-links of a predetermined communication quality or more, from among signals received by the receiver; and
- a transmitter for transmitting the signals to the up-links with the up-transmission power determined by the up-link transmission power calculation unit.

[7] The mobile station apparatus according to Claim 6, wherein, in determining up-transmission power by the up-link transmission power calculation unit, a determination is made to raise the up- transmission power when all pieces of the up- transmission power instruction information
5 extracted from signals received from the down-links of the predetermined quality or more are instructions for raising the transmission power, and a determination is made to lower the up-transmission power when at least one piece of up-transmission power instruction information is an instruction for lowering the up-transmission power.

10

[8] The mobile station apparatus according to Claim 6 or 7 further comprising:

a down-link receiving level measurement unit for measuring a receiving level of the down-link in the receiver; and

5 a down link receiving level comparison unit for transmitting down-transmission power instruction information for instructing that the down-transmission power be lowered to the up-link via the transmitter when the receiving level measured by the down-link receiving level measurement unit is not lower than a predetermined target value, and for transmitting down-
10 transmission power instruction information for instructing that the down-transmission power be raised to the up-link via the transmitter when the receiving level measured by the down-link receiving level measurement unit is below the predetermined target value.
